

REAR CONSOLE – WIRELESS CHARGER

WACM (Wireless Accessory Charging Module)

The WACM is powered by the vehicle's Body Control Module (BCM)

In a standard sedan the WACM output of the BCM is disabled by default and the output is not wired in the OEM harness

For the coach-specific variant, wiring is added to the OEM harnesses and the BCM is reconfigured to enable the WACM

Note: the WACM is connected to the vehicle CAN bus & Anti-Theft systems - it will only function when the BCM is reconfigured

BCM Reconfiguration

If the BCM is replaced, reset, or reflashed it may be necessary to reconfigure it to enable the WACM in the vehicle's system

The setting is found in the BCM ECU Configuration
